

How we use data to eliminate climate risk from your business

Today, your organisation's bottom line will be impacted by climate change. Risks include:

- Rapidly increasing cost of carbon pushing energy prices up
- Growing customer demand for green products & services
- Tightening legislative and reporting regulations

Organisations that develop and deliver net-zero carbon strategies are ensuring that they are minimising climate risk for years to come.

Plan Zero combines Mitie's detailed property knowledge, with our extensive carbon and energy reduction capabilities to design bespoke cost and carbon reduction strategies.

Our Sustainability Consultants utilise our market leading data analysis tools to identify opportunities to optimise, reduce and eradicate carbon & cost.

Plan Zero is applicable to all organisations regardless of net-zero strategy maturity, organisation size or sector.

Plan Zero utilises data to develop bespoke carbon and cost saving solutions

Consumption Analysis

Mitie's energy experts analyse utility consumption data, calculating the optimal strategy to optimise efficiency and reduce cost.

Pathway to Zero

Designing and setting a net-zero operational carbon strategy across an organisation is complex. Plan Zero Pathways analyse organisational data, designing deliverable costed solutions.

Building Assessments

Detailed assessments of a priority site(s) performance and data to identify the solutions required to achieve net-zero across the facility.

Achievable and affordable decarbonisation solutions

Designing your net-zero strategy provides a platform upon which organisations can build and grow efficient, environmentally aware operations. But cost and affordability is frequently a factor blocking the uptake of sustainability programmes.

Mitie firmly believes that doing the right thing shouldn't cost the earth and that being sustainable is affordable and achievable for every organisation.

Solutions that assist in the reduction of carbon include low carbon heating & cooling, LED lighting, EV charging infrastructure, solar PV and battery storage. Sometimes the upfront costs of these solutions can make it difficult to get these innovations off the ground.

Decarbonisation As a Service is a simple solution where the user only pays for decarbonisation services it receives, with an upfront one-off investment replaced with a regular service fee.

Decarbonisation As a Service enables organisations to fund net-zero carbon programmes.

Single contract to design, install and maintain services

Simple payment mechanism aligned to service delivery

Potential for off balance sheet financial treatment

A guaranteed level of service and carbon saving
